

PATIENT EDUCATION GUIDE

Hair Fall & Thinning

A general guide to common patterns, possible contributing factors, and professional treatment options.

01 Hair Fall

Increased shedding that may be noticed during washing, brushing, or throughout the day.

02 Crown Thinning

Reduced-looking density around the crown or top of the scalp.

03 Patchy Hair Loss

Hair loss that appears more noticeable in specific areas rather than evenly across the scalp.

04 Weak or Low-Density Hair

Hair that may appear finer, weaker, or less dense over time.

Important: Hair fall can have different contributing factors. This guide is educational and does not diagnose the cause of hair loss. A dermatologist can assess your individual pattern and recommend appropriate next steps.

Not sure what may be contributing to your hair fall or thinning?

Start with a professional scalp and hair assessment.

TREATMENT OPTIONS

Possible Treatment Options

Depending on the pattern, severity, medical history, and assessment findings, a dermatologist may discuss one or more of the following options.

PRP

Uses platelet-rich plasma prepared from your own blood and delivered to the scalp. Your dermatologist may consider it as part of a treatment plan for selected hair-loss patterns.

GFC

Uses concentrated growth-factor preparations intended to support the scalp and hair follicles. Suitability depends on the individual assessment.

Mesotherapy

Involves delivering selected substances into the scalp. The exact formulation and suitability should be determined by a qualified medical professional.

Hair Transplant

A surgical procedure that moves hair follicles from a donor area to areas with reduced density. It is considered in selected cases where appropriate.

Treatment selection should be based on a clinical assessment. Combination treatment may be considered when appropriate.

KNOW THE STAGES

Understanding Hair-Loss Patterns

The appearance of hair loss can vary from person to person. Early evaluation may help identify the pattern and guide appropriate care.

STAGE 01

Early / Mild

WHAT YOU MAY NOTICE

Hair shedding or subtle reduction in density may be noticed.

WHAT TO DO

A dermatologist can assess possible causes and discuss suitable hair-care or medical options.

STAGE 02

Moderate

WHAT YOU MAY NOTICE

Thinning becomes more noticeable and hair density may appear reduced in specific areas.

WHAT TO DO

Professional assessment can help determine whether medical or procedural treatments may be appropriate.

STAGE 03

Advanced

WHAT YOU MAY NOTICE

More visible thinning or areas of significant density loss may be present.

WHAT TO DO

Depending on the findings, a dermatologist may discuss medical treatment, procedures, or surgical options.

Note: Do not self-diagnose from photos alone. Hair-loss patterns can overlap, and the underlying cause may require a proper clinical history and scalp examination.

YOUR CONSULTATION

Why Professional Assessment Matters

Hair fall is not always caused by the same factor. A consultation can help a dermatologist understand your pattern, history, and individual needs before suggesting treatment.

Dr. Sindhu's Derma Solutions

MEDICAL & AESTHETIC DERMATOLOGY

For concerns related to hair fall, thinning, scalp health, and other dermatology needs, seek an assessment from a qualified dermatologist.

Evidence-based care • Individual assessment • Clear treatment discussion

Ready to Understand Your Hair Fall?

Book a consultation with Derma Solutions to discuss your hair and scalp concerns and understand which options may be suitable for you.
